this is the definitive presentation of the history development and philosophical significance of non euclidean geometry as well as of the rigorous foundations for it and for elementary euclidean geometry essentially according to hilbert appropriate for liberal arts students prospective high school teachers math majors and even bright high school students the first eight chapters are mostly accessible to any educated reader the last two chapters and the two appendices contain more advanced material such as the classification of motions hyperbolic trigonometry hyperbolic constructions classification of hilbert planes and an introduction to riemannian geometry

this book gives a rigorous treatment of the fundamentals of plane geometry euclidean spherical elliptical and hyperbolic

this book develops a self contained treatment of classical euclidean geometry through both axiomatic and analytic methods concise and well organized it prompts readers to prove a theorem yet provides them with a framework for doing so chapter topics cover neutral geometry euclidean plane geometry geometric transformations euclidean 3 space euclidean n space perimeter area and volume spherical geometry hyperbolic geometry models for plane geometries and the hyperbolic metric

a reissue of professor coxeter s classic text on non euclidean geometry

the distinctive approach of henderson and taimina s volume stimulates readers to develop a broader deeper understanding of mathematics through active experience including discovery discussion writing fundamental ideas and learning about the history of those ideas a series of

interesting challenging problems encourage readers to gather and discuss their reasonings and understanding the volume provides an understanding of the possible shapes of the physical universe the authors provide extensive information on historical strands of geometry straightness on cylinders and cones and hyperbolic planes triangles and congruencies area and holonomy parallel transport sss ass saa and aaa parallel postulates isometries and patterns dissection theory square roots pythagoras and similar triangles projections of a sphere onto a plane inversions in circles projections models of hyperbolic planes trigonometry and duality 3 spheres and hyperbolic 3 spaces and polyhedra for mathematics educators and other who need to understand the meaning of geometry

geometry by construction challenges its readers to participate in the creation of mathematics the questions span the spectrum from easy to newly published research and so are appropriate for a variety of students and teachers from differentiation in a high school course through college classes and into summer research any interested geometer will find compelling material back cover

foundation of euclidean and non euclidean geometries according to f klein aims to remedy the deficiency in geometry so that the ideas of f klein obtain the place they merit in the literature of mathematics this book discusses the axioms of betweenness lattice of linear subspaces generalization of the notion of space and coplanar desargues configurations the central collineations of the plane fundamental theorem of projective geometry and lines perpendicular to a proper plane are also elaborated this text likewise covers the axioms of motion basic projective configurations properties of triangles and theorem of duality in projective space other topics include the point coordinates in an affine space and consistency of the three geometries this publication is beneficial to mathematicians and students learning geometry

this undergraduate textbook provides a comprehensive treatment of euclidean and transformational geometries supplemented by substantial discussions of topics from various non euclidean and less commonly taught geometries making it ideal for both mathematics majors and pre service teachers emphasis is placed on developing students deductive reasoning skills as they are guided through proofs constructions and solutions to problems the text frequently emphasizes strategies and heuristics of problem solving including constructing proofs where to begin how to proceed which approach is more promising are there multiple solutions proofs etc this approach aims not only to enable students to

successfully solve unfamiliar problems on their own but also to impart a lasting appreciation for mathematics the text first explores at a higher level and in much greater depth topics that are normally taught in high school geometry courses definitions and axioms congruence circles and related concepts area and the pythagorean theorem similarity isometries and size transformations and composition of transformations constructions and the use of transformations to carry out constructions are emphasized the text then introduces more advanced topics dealing with non euclidean and less commonly taught topics such as inversive hyperbolic elliptic taxicab fractal and solid geometries by examining what happens when one or more of the building blocks of euclidean geometry are altered students will gain a deeper understanding of and appreciation for euclidean concepts to accommodate students with different levels of experience in the subject the basic definitions and axioms that form the foundation of euclidean geometry are covered in chapter 1 problem sets are provided after every section in each chapter and include nonroutine problems that students will enjoy exploring while not necessarily required the appropriate use of freely available dynamic geometry software and other specialized software referenced in the text is strongly encouraged this is especially important for visual learners and for forming conjectures and testing hypotheses

non euclidean geometry by henry parker manning is a comprehensive exploration of geometrical systems that deviate from euclidean geometry challenging traditional notions of space distance and parallel lines manning introduces readers to the fascinating world of non euclidean geometries providing insights into their development principles and applications key points manning introduces readers to the groundbreaking works of mathematicians like nikolai lobachevsky jános bolyai and carl friedrich gauss who pioneered the development of non

euclidean geometries revolutionizing our understanding of geometric principles and expanding the boundaries of mathematical thought the book delves into the different types of non euclidean geometries such as hyperbolic and elliptic geometries presenting their distinctive properties axioms and geometric constructions manning explores the implications of these alternative geometries on concepts such as angles triangles and the nature of space itself non euclidean geometry offers readers a captivating journey into the realm of abstract mathematics challenging preconceived notions of geometric truth and illuminating the beauty and diversity of mathematical systems it is a valuable resource for mathematicians students and anyone fascinated by the profound exploration of the nature of space and geometry

in this book dr coolidge explains non euclidean geometry which consists of two geometries based on axioms closely related to those specifying euclidean geometry as euclidean geometry lies at the intersection of metric geometry and affine geometry non euclidean geometry arises when either the metric requirement is relaxed or the parallel postulate is replaced with an alternative one in the latter case one obtains hyperbolic geometry and elliptic geometry the traditional non euclidean geometries when the metric requirement is relaxed then there are affine planes associated with the planar algebras which give rise to kinematic geometries that have also been called non euclidean geometry the essential difference between the metric geometries is the nature of parallel lines euclid s fifth postulate the parallel postulate is equivalent to playfair s postulate which states that within a two dimensional plane for any given line l and a point a which is not on l there is exactly one line through a that does not intersect l in hyperbolic geometry by contrast there are infinitely many lines through a not intersecting l while in elliptic geometry any line through a intersects l another way to describe the differences between these geometries is to consider two straight lines indefinitely extended in a two dimensional plane that are both perpendicular to a third line in euclidean geometry the lines remain at a constant distance from each other meaning that a line drawn perpendicular to one line at any point will intersect the other line and the length of the line segment joining the points of intersection remains constant and are known as parallels in hyperbolic geometry they curve away from each other increasing in distance as one moves further from the points of intersection with the common perpendicular these lines are often called ultraparallels in elliptic geometry the lines curve toward each other and intersect

one of the first college level texts for elementary courses in non euclidean geometry this volume is geared toward students familiar with calculus topics include the fifth postulate hyperbolic plane geometry and trigonometry and elliptic plane geometry and trigonometry extensive appendixes offer background information on euclidean geometry and numerous exercises appear throughout the text reprint of the holt rinehart winston inc new york 1945 edition

examines various attempts to prove euclid's parallel postulate by the greeks arabs and renaissance mathematicians it considers forerunners and founders such as saccheri lambert legendre wolyai gauss others includes 181 diagrams
